Problem 1

Problem 3

a)

ii) 10-fold Cross-Validation

Model Accuracy

```
# Predict outcome using model from training data based on testing data
predictions <- predict(cvmodel, newdata=test)

# Create confusion matrix to assess model fit/performance on test data
con_matx <- confusionMatrix(data=predictions, test$COMMIT)
con_matx
```

```
## Confusion Matrix and Statistics

```

```
## Variance: 36
```

Maximum likelihood estimator (MLE) of the parameters from the Weibull distribution

Maximum Likelihood Estimator (MLE) of σ from the normal distribution assuming μ is constant.

Step 1: Probability Density Function for a normal distribution.

$$f(x; \lambda, k) = \begin{cases} \frac{k}{\lambda} \left(\frac{x}{\lambda}\right)^{k-1} e^{-\left(\frac{x}{\lambda}\right)^k}, & x \geq 0 \\ 0, & x < 0 \end{cases}$$

Step 2: The likelihood function (L).

$$\begin{aligned} L_{\hat{x}}(\lambda, k) &= \prod_{i=1}^n \frac{k}{\lambda} \left(\frac{x_i}{\lambda}\right)^{k-1} e^{-\left(\frac{x_i}{\lambda}\right)^k} \\ &= \left(\frac{k}{\lambda}\right)^n \left(\frac{1}{\lambda^{k-1}}\right)^n \left(\prod_{i=1}^n x_i^{k-1}\right) \left(e^{-\sum_{i=1}^n \left(\frac{x_i}{\lambda}\right)^k}\right) \\ &= \frac{k^n}{\lambda^{nk}} e^{-\sum_{i=1}^n \left(\frac{x_i}{\lambda}\right)^k} \prod_{i=1}^n x_i^{k-1} \end{aligned}$$

Step 3: The log-likelihood function (ln(L)).

$$\ln L_{\hat{x}}(\lambda, k) = n \ln(k) - nk \ln(\lambda) - \sum_{i=1}^n \left(\frac{x_i}{\lambda}\right)^k + (k-1) \sum_{i=1}^n \ln x_i$$

Step 4: Derivative of the log-likelihood function ($\ln(L)$).

$$\frac{d \ln L_{\hat{x}}(\lambda, k)}{d\lambda} = -\frac{nk}{\lambda} + k \sum_{i=1}^n \frac{x_i^k}{\lambda^{k+1}}$$

MAYBE COMBINE STEP 4 AND 5!!!!!!!!!!!!!!

Step 5: Solving for the desired parameters.

Therefore the estimator $\hat{\lambda}$ is:

$$\hat{\lambda} = \left(\frac{1}{n} \sum_{i=1}^n x_i^k \right)^{\frac{1}{k}}$$

Plugging in $\hat{\lambda}$ into the log-likelihood function ($\ln(L)$) and then differentiating with respect to k :

$$\begin{aligned} \frac{d \ln L_{\hat{x}}(\lambda, k)}{dk} &= \frac{d}{dk} \left[n \ln(k) - nk \ln(\lambda) - \sum_{i=1}^n \left(\frac{x_i}{\lambda} \right)^k + (k-1) \sum_{i=1}^n \ln x_i \right] \\ &= x \end{aligned}$$

Therefore the estimator \hat{k} is:
